

Fedora School Delivery and Offline Licensing

How OpenClassCraft will package the Fedora build, fulfil school purchases, verify a campus licence without internet, handle renewal, and end paid entitlements without locking away the free game or school data.

OWNER-REVIEW DRAFT · NOT A LIVE PAID SERVICE

CORE DECISION

Ship one public Fedora Community RPM that never expires. A school purchases the separately delivered Teacher Console, curriculum delivery, onboarding, eligible updates, and support for a defined campus term.

PRIMARY PLATFORM

Fedora 44 x86_64

COMMERCIAL UNIT

One physical campus

VERIFICATION

Offline signed licence

RENEWAL

Manual annual payment

EXPIRY SAFETY

30-day grace; export-only

STUDENT SUBSCRIPTION

None

Prepared 27 August 2026 · Audience: project owner, engineering, pilot schools, and professional advisers

One game, two ways to adopt it

Community and OpenClassCraft for Schools are not incompatible games. They are one core game with different delivery, operations, and support.

Component	Community	OpenClassCraft for Schools
Fedora game	Free public RPM; offline play and LAN multiplayer; no expiry.	The exact same verified RPM. No customer-specific fork.
Teacher Console	Not included in the Community release.	Controlled Fedora-compatible AppImage for the campus term.
Curriculum	Public starter material and community contributions.	Operational lesson packs delivered during the plan term.
Adoption services	Self-service documentation.	Lab readiness, onboarding, teacher training, and agreed support.
After term	Everything continues.	Console becomes export-safe read-only after grace; game continues.

What the school pays for

- A maintained operational Teacher Console.
- Lab readiness, onboarding, and teacher training.
- Supported curriculum delivery and eligible updates.
- Defined support during the campus term.
- Dependable adoption—not permission to keep playing the game.

Non-negotiable product rules

- No student-level subscription or per-seat fee.
- No mandatory cloud account for classroom play.
- No deletion or lock-in of school-owned data at expiry.
- No customer-specific game fork or premium LAN protocol.
- No production claim before every paid-readiness gate passes.

Proposed school offers

Offer	Price	Term	Purpose
Community	₹0	No expiry	Families, clubs, and self-supported schools
First 3 qualified private pilots	₹0	90 days	Evidence and classroom fit
Guided beta	₹4,999	8 weeks	Structured proof-of-fit; proposed credit to annual
Founding annual	₹12,499	First campus year	Early converting pilot schools
Standard annual	₹24,999	Campus/year	Planned renewal or later new-school price

COMMERCIAL GATE

Prices are proposals. Do not accept a paid annual order until the Console licence, agreement, privacy notice, support scope, refund/cancellation terms, and India-appropriate tax/invoice process are approved.

The supported Fedora package contract

The development machine and release workflow both target Fedora 44. This gives the project one exact environment to build, install, and physically validate first.

Artifact	Audience and channel	Required proof
OpenClassCraft-Fedora-44-x86_64.rpm	Everyone · public Community release	SHA-256, RPM/detached signature, exact tag/source, licence notices
OpenClassCraft-Fedora-44-x86_64.rpm.sha256	Everyone · beside the RPM	Checksum validates the exact released bytes
Teacher-Console-0.1.0-linux-x86_64.AppImage	Authorised school contact · controlled delivery	Checksum, signature, version, approved licence and notices
school.occdicence	One named campus · private delivery	Valid project signature and matching campus term

1 · BUILD

Fedora 44 container

2 · TEST

Unit + fresh world

3 · PACKAGE

CPack RPM

4 · INSTALL

Clean Fedora

5 · SIGN

RPM + proof

6 · PILOT

Two-device LAN

Already present

- Fedora 44 CI container and RPM generation.
- RPM content checks and clean installation.
- Engine tests and fresh-world server smoke test.
- SHA-256 generation.
- Separate Community and Console artifacts.
- Allow-list that rejects Console files from public releases.

Required before supported release

- Make Fedora—not Windows—the first public alpha scope.
- Physically test install, launch, update, and uninstall.
- Test LAN discovery and manual fallback on two devices.
- Sign the RPM and publish verification instructions.
- Record known limitations and rollback procedure.
- Retain the previous known-good artifact.

INSTALLATION CONTRACT

A teacher installs with: `sudo dnf install ./OpenClassCraft-Fedora-44-x86_64.rpm` — then starts: `openclasscraft`. The public RPM must work without the Console or a licence file.

SCOPE CONTROL

Ubuntu and Windows remain later validation targets, but they must not delay Fedora proof. Do not promise support from untested CI artifacts alone.

How a school receives the package

Start with an owner-controlled, manually renewed annual plan. A school gets a clear order, one verified package, and named onboarding—not an anonymous consumer checkout.

Recommended payment model

- Use a written order or quotation, then a one-time payment link or bank transfer.
- No automatic debit during the founding stage.
- Link every payment reference to the campus register.
- Reconcile the actual cleared status—not a screenshot.
- Put taxes, refunds, cancellation, and support in the signed order.

School delivery bundle

- README-FIRST.pdf and teacher quick-start material.
- Signed Teacher Console AppImage.
- Unique school.occllicense campus entitlement.
- SHA256SUMS and detached signature.
- Approved licence and third-party notices.
- Link to the same public Community RPM.

WHY MANUAL ANNUAL RENEWAL

Razorpay documents Payment Links as one-time payments and currently documents a ₹15,000 domestic card/UPI recurring limit. The proposed ₹24,999 standard plan therefore fits a fresh annual school approval better than an automatic mandate.

Private customer register — never commit it to the public repository

Identity	Commercial	Delivery	Lifecycle
Campus ID, legal school name, approved contact	Order/invoice reference, plan, amount, cleared status	Version, hashes, licence ID, delivered date	Start, expiry, grace end, renewal and support status

Internet requirements

Activity	Internet?	Offline alternative
Pay and reconcile	Normally yes	Approved bank/procurement process
Initial download	Normally yes	School-approved USB/removable media
Licence check and lessons	No	Local signature/date check and trusted LAN
Renew	Communication normally yes	Import the replacement licence by USB

CURRENT-STATE WARNING

Payment fulfilment and automatic expiry are not implemented in the current Console. Do not collect an annual payment assuming the present build will enforce the school term—it will not.

One binary, one campus licence file

Every school receives the same signed Console build. A small unique licence grants campus features for a defined term and is verified locally without contacting a server.

OWNER SIGNER

Private Ed25519 key outside Git

LICENCE FILE

Campus + dates + features

CONSOLE

Embedded public verification key

ENTITLEMENT

Active · grace · expired · invalid

Illustrative payload

```
{
  "schema": 1,
  "license_id": "OCC-SCH-2026-0001",
  "campus_id": "campus_7f31...",
  "school_name": "Example School",
  "plan": "founding-annual",
  "starts_on": "2026-10-01",
  "expires_on": "2027-09-30",
  "grace_days": 30,
  "features": ["console.edit",
               "lesson.bridge",
               "supported.updates"],
  "signature": "base64url..."
}
```

FORMAT RULE

The signature covers canonical bytes for every field except signature. Specify date inclusivity, encoding, algorithm, schema evolution, and maximum file size.

Verification rules

- 1 Parse a bounded document with an exact supported schema.
- 2 Reject missing, malformed, oversized, or unknown-critical values.
- 3 Verify the Ed25519 signature with the embedded public key.
- 4 Compare UTC date with start, expiry, and grace boundaries.
- 5 Return ACTIVE, EXPIRING, GRACE, EXPIRED, or INVALID.
- 6 Enforce capabilities in Electron's main process—not only the UI.
- 7 Log status changes without student or payment data.

NO SECRET IN THE APP

Only the public key belongs in the repository and Console. Encrypt, restrict, and securely back up the private signing key; never expose it to CI logs or artifacts.

OFFLINE LIMITATION

An offline licence cannot be revoked immediately, and device-clock tampering cannot be prevented perfectly. Use written terms and soft clock-rollback detection; do not add always-online DRM to the founding product.

Stop paid entitlements, not learning

Expiry must be predictable, reversible through renewal, and safe for school-owned data. The Community game never checks the School licence.

When	State and behaviour
30 days before expiry	EXPIRING · Show exact end/grace dates, renewal contact, and export reminder. All functions continue.
Expiry date	GRACE · Start a 30-day grace period with a persistent renewal notice. Normal operation continues.
Grace end	EXPIRED · Switch to read/export mode. Stop edits, bridge sessions, supported updates, and plan support.
Renewal	ACTIVE · Import a newly signed .occllicense. Existing workspace remains; no reinstall is required.

Capability after grace

Capability	Result	Reason
Community game, existing worlds, LAN	CONTINUES	The free game is not a subscription product.
View Console workspace	CONTINUES	Teachers retain access to local records.
Export CSV reports and JSON backups	CONTINUES	Expiry must never trap school-owned data.
Create/edit lessons, students, groups	PAUSES	Operational capability belongs to the school term.
Start or export lesson bridge sessions	PAUSES	Enforced in the Electron main process.
Receive Console/curriculum updates	PAUSES	Update entitlement ends with the term.
Receive plan support or training	PAUSES	Service scope ends unless separately agreed.

Renewal procedure

- Send reminders at 60 and 30 days.
- Confirm term, price, support, and authorised contact.
- Issue a fresh order and reconcile payment.
- Create a new licence with new ID and dates.
- Import and record activation; no reinstall required.

Cancellation or non-renewal

- Do not auto-charge without an approved mandate.
- Apply the written refund/cancellation terms.
- Keep export and backup available.
- Provide uninstall and retention instructions.
- Never remotely delete the workspace.

ENFORCEMENT BOUNDARY

Do not rely on disabled buttons. Every mutating IPC action and the loopback bridge must independently require ACTIVE, EXPIRING, or GRACE status in the Electron main process.

Implementation sequence and acceptance

Build licensing only after the Fedora package is dependable. Each phase must leave an independently testable result and a documented rollback.

Phase	Implementation	Exit criteria
0 · Commercial gates	Approve Console licence, campus agreement, privacy, support, cancellation/refund, invoice/tax process, and key custodian.	Signed templates exist; owner authorises paid fulfilment.
1 · Fedora baseline	Change public alpha scope to Fedora; physical RPM and two-device LAN tests; add signing and verification.	Tagged candidate passes the release checklist on Fedora 44 hardware.
2 · Licence core	Versioned schema/canonical bytes; Ed25519 issue/verify tools; status model; private key outside Git.	Test vectors pass; tampering fails; no secret in source, logs, or artifacts.
3 · Console enforcement	Import/status IPC; guard mutations; stop bridge after grace; preserve view/report/backup; add renewal UI.	Expired/invalid licences cannot mutate or bridge; exports work.
4 · Fulfilment	Private register, manifests, delivery guide, reminders, reissue, incident and recovery procedures.	A test payment-to-clean-install dry run is auditable.
5 · Controlled beta	Free pilots first; observe install, onboarding, bridge, warnings, exports, and support load.	One authorised pilot completes with no unresolved critical defect.

Required licence tests

- Valid signature and supported schema.
- Invalid key, signature, payload, dates, and features.
- Before-start, exact boundaries, grace, and expired states.
- Leap day, month end, local timezone, and UTC conversion.
- Oversized/malformed file and path failures.

Required Console/package tests

- Every mutating IPC route rejects expired/invalid status.
- Active bridge stops when entitlement expires.
- View/report/backup exports work after expiry.
- Replacement licence activates without data loss.
- Build contains public key only—no signing secret or customer fixture.

SUGGESTED DELIVERY RHYTHM

Four focused engineering/operations weeks for the Fedora baseline and offline licence path, followed by the existing eight-week guided beta. This is a planning sequence—not a public date commitment.

Controls that keep the model trustworthy

The goal is practical distribution control and reliable service—not hostile DRM. Protect package integrity, signing authority, classroom privacy, and recovery.

Signing and package integrity

- Generate signing keys outside the repository.
- Encrypt and back up private keys; assign an issuer.
- Sign Fedora RPMs and delivery-bundle checksums.
- Publish verification key/fingerprint through trusted channels.
- Record tag, package hash, Console version, and licence ID.
- Define key rotation and compromise response before issuance.

Classroom privacy and recovery

- Use classroom aliases; do not require student accounts.
- Keep workspace and bridge local to the teacher device.
- Never place student data in licences or payment records.
- Keep backup/export available before and after expiry.
- Document retention, uninstall, and incident procedures.
- Stop deployment on privacy, data-loss, tampering, or permission failures.

Known risks and treatment

Risk	Decision	Residual limitation
Clock set backwards	Record last-seen time; warn or enter safe/read-only mode on material rollback.	A privileged local user can manipulate state.
Immediate cancellation	Use written terms; stop service/download access; signed licence reaches expiry.	No instant revocation without an online check.
Licence copied	Bind commercial rights to one campus; avoid hard hardware locking initially.	Offline copying cannot be prevented perfectly.
Signing key exposed	Rotate key/version, notify schools, and reissue licences through a trusted update.	Old offline binaries need an update to trust new policy.
Licence file lost	Verify authorised contact and issue an auditable replacement.	Requires an accurate private register.
Community game shared	Expected under applicable open-source licences; monetise Console rights and services.	Business cannot depend on blocking game sharing.

LEGAL AND LICENCE REALITY

The repository contains mixed upstream and project licences. Preserve required notices. The Teacher Console is currently marked UNLICENSED; owner-approved redistribution and commercial-use terms are required before paid delivery.

DATA PRINCIPLE

A licence proves campus entitlement; it is not a student identity system. Include campus/commercial identifiers only—never student names, progress, worlds, or bridge tokens.

Definition of ready for the first paid school

A successful pilot is not automatically a production licence. Every item below needs evidence and owner approval before an annual payment is accepted.

Product and Fedora

- Fedora RPM installs, launches, updates, and uninstalls cleanly.
- Two physical devices pass discovery and manual LAN fallback.
- RPM and Console signatures verify using published steps.
- Known limitations and rollback artifact are available.
- Public release excludes every Console/customer file.

Licence implementation

- Schema, dates, canonicalisation, features, and rotation are documented.
- Private key has an owner and recovery procedure.
- Invalid/expired status cannot mutate state or run bridge.
- View, report export, and backup work after expiry.
- Renewal activates without reinstall or workspace loss.

Commercial and school operations

- Console licence and third-party notices are approved.
- Agreement states campus, term, scope, privacy, and termination.
- Professional review covers entity, invoice, tax, refund, and cancellation.
- Private customer register and access controls are ready.
- Payment, delivery, renewal, reissue, and incident dry run passes.

Pilot evidence

- Teacher completes onboarding and three classroom sessions.
- Backup/restore and exports pass with disposable alias-only data.
- No unresolved critical privacy, package, security, or data-loss issue.
- Support effort and renewal value are reviewed against price.
- Owner records an explicit production go/no-go decision.

LAUNCH RULE

If any legal, payment, signing, expiry, export, privacy, or physical Fedora gate is incomplete, continue with an explicitly controlled free beta. Do not represent the School package as a finished paid subscription.

Immediate next actions

Priority	Action	Owner output
1	Approve Fedora as the only initial public support target and change the release scope.	Fedora candidate tag and physical test record
2	Complete owner/legal/accounting review of the School commercial package.	Approved agreement, licence, invoice, privacy and support terms
3	Implement the offline licence core and export-safe Console enforcement.	Test vectors, signed demo licence, expiry QA report
4	Rehearse test payment-to-delivery on a clean Fedora device.	Auditable fulfilment record without customer/student data
5	Run free founding pilots before enabling paid annual fulfilment.	Pilot evidence, defect log, go/no-go decision
